Most Common Road Suffix Graph: This graph represents the most common road suffix for each individual county across the United States, with the x and y axes being latitude and longitude. Each color represents the top seven most common road suffixes. The most common road suffix can be seen in blue, which is “Rd”, prevailing across numerous regions in the country. The graph also shows that in each state the most common road suffix is likely the same for every county within that state.

2nd Most Common Road Suffix Graph: This graph of the US shows the 2nd most common type of road in every county in the United States. The legend on the right of the map shows the different colors with the different road suffixes that each represents. “St” is the second most common suffix in a lot of areas with “Dr”, “Rd”, and “Co Rd” having a lot as well.

Road = Most Common Graph: For our last graph, we made a graph that shows how many different counties have “Road” as the most common suffix. We did this because we found it very interesting that there are so many different counties that are the same. “Road” is the most common suffix of 46.59% of counties. The blue color shows counties that Road is the most common while the red shows counties that have others.
